TECHNIQUE

RESULTS

- Mendel chose to track only those characters that varied in an either-or manner
- He also used varieties that were _____ (plants that produce offspring of the same variety when they self-pollinate)

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- In a typical experiment, Mendel mated two contrasting, true-breeding varieties, a process called _____
- The true-breeding parents are the P generation
- The hybrid offspring of the P generation are called the F₁ generation
- When _____ individuals self-pollinate, the _____ generation is produced

The Law of Segregation

- When Mendel crossed contrasting, true-breeding white and purple flowered pea plants, all of the F₁ hybrids were _____
- When Mendel crossed the F₁ hybrids, many of the F₂ plants had purple flowers, but some had _____
- Mendel discovered a ratio of about three to one, purple to white flowers, in the F₂ generation

- Mendel reasoned that only the purple flower factor was affecting flower color in the _____ hybrids
- Mendel called the purple flower color a _____ trait and the white flower color a _____ trait

Mendel's Model

- Mendel developed a hypothesis to explain the ____ inheritance pattern he observed in F₂ offspring
- Four related concepts make up this model
- These concepts can be related to what we now know about genes and _____

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- The first concept is that alternative versions of _____ account for variations in inherited characters
- For example, the gene for flower color in pea plants exists in two versions, one for purple flowers and the other for white flowers
- These alternative versions of a gene are now called alleles
- Each gene resides at a specific _____ on a specific chromosome

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

Fig. 14-4

- The second concept is that for each character an organism inherits two _____, one from each parent
- Mendel made this deduction without knowing about the role of chromosomes
- The two alleles at a locus on a chromosome may be identical, as in the true-breeding plants of Mendel's P generation
- Alternatively, the two alleles at a locus may differ, as in the ____ hybrids

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- The third concept is that if the two alleles at a locus differ, then one (the _____ allele) determines the organism's appearance, and the other (the recessive allele) has no noticeable effect on appearance
- In the flower-color example, the F₁ plants had purple flowers because the allele for that trait is _____

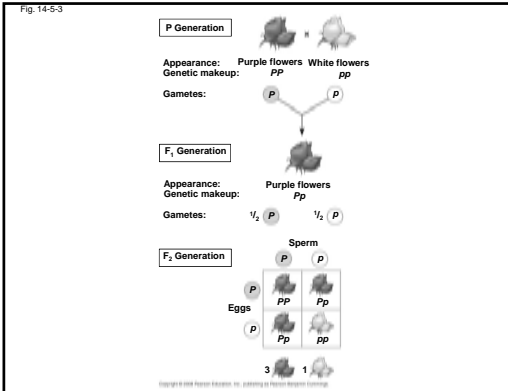

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- The fourth concept, now known as the _____, states that the two alleles for a heritable character separate (segregate) during gamete formation and end up in different gametes
- Thus, an egg or a sperm gets only one of the two alleles that are present in the somatic cells of an organism
- This _____ of alleles corresponds to the distribution of homologous chromosomes to different gametes in meiosis

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- Mendel's segregation model accounts for the _____ ratio he observed in the F₂ generation of his numerous crosses
- The possible combinations of sperm and egg can be shown using a _____, a diagram for predicting the results of a genetic cross between individuals of known genetic makeup
- A capital letter represents a dominant allele, and a lowercase letter represents a _____ allele

Useful Genetic Vocabulary

- An organism with two identical alleles for a character is said to be _____ for the gene controlling that character
- An organism that has two different alleles for a gene is said to be heterozygous for the gene controlling that character
- Unlike homozygotes, _____ are not true-breeding

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- Because of the different effects of dominant and recessive alleles, an organism's traits do not always reveal its _____
- Therefore, we distinguish between an organism's phenotype, or physical appearance, and its genotype, or genetic makeup
- In the example of flower color in pea plants, ___ and ___ plants have the same phenotype (purple) but different genotypes

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

The Testcross

- How can we tell the genotype of an individual with the _____ phenotype?
- Such an individual must have one dominant allele, but the individual could be either homozygous dominant or heterozygous
- The answer is to carry out a _____: breeding the mystery individual with a homozygous recessive individual
- If any offspring display the recessive phenotype, the mystery parent must be _____

Fig. 14-7a

Fig. 14-7b

The Law of Independent Assortment

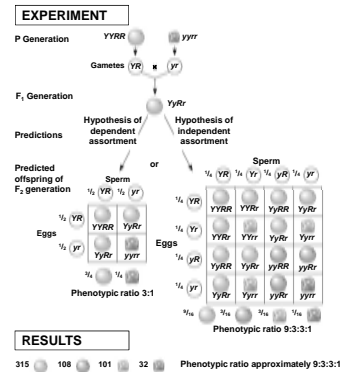

- Mendel derived the law of segregation by following a single character
- The F_1 offspring produced in this cross were monohybrids, individuals that are heterozygous for one character
- A cross between such heterozygotes is called a

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- Mendel identified his second law of inheritance by following two characters at the same time
- Crossing two true-breeding parents differing in two characters produces _____ in the F_1 generation, heterozygous for both characters
- A dihybrid cross, a cross between F_1 dihybrids, can determine whether two characters are transmitted to offspring as a package or independently

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

Fig. 14-8

- Using a dihybrid cross, Mendel developed the _____
- The law of independent assortment states that each pair of alleles segregates independently of each other pair of alleles during gamete formation
- Strictly speaking, this law applies only to genes on different, nonhomologous chromosomes
- Genes located near each other on the same chromosome tend to be inherited _____

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

The laws of probability govern Mendelian inheritance

- Mendel's laws of segregation and independent assortment reflect the rules of _____
- When tossing a coin, the outcome of one toss has no impact on the outcome of the _____
- In the same way, the alleles of one gene segregate into gametes independently of another gene's alleles

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

The Multiplication and Addition Rules Applied to Monohybrid Crosses

- The multiplication rule states that the probability that two or more independent events will occur together is the product of their individual probabilities
- Probability in an F₁ monohybrid cross can be determined using the multiplication rule
- Segregation in a heterozygous plant is like flipping a coin: Each gamete has a 1/2 chance of carrying the dominant allele and a 1/2 chance of carrying the _____ allele

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

Copyright © 2008 Pearson Education Inc., publishing as Pearson Benjamin Cummings

- The _____ states that the probability that any one of two or more exclusive events will occur is calculated by adding together their individual probabilities
- The _____ can be used to figure out the probability that an F₂ plant from a monohybrid cross will be heterozygous rather than homozygous

Solving Complex Genetics Problems with the Rules of Probability

- We can apply the multiplication and addition rules to predict the outcome of crosses involving _____
- A dihybrid or other multicharacter cross is equivalent to two or more independent monohybrid crosses occurring simultaneously
- In calculating the chances for various genotypes, each character is considered separately, and then the individual probabilities are multiplied together

Multiple Alleles

- Most genes exist in populations in more than _____ allelic forms

Nature and Nurture: The Environmental Impact on Phenotype

- Another departure from Mendelian genetics arises when the phenotype for a character depends on _____ as well as genotype
